Free and Easy Fixes

- Change your light bulbs to the new style of LED light bulbs – they convert nearly 100% of the energy they consume as light.

- Turn off the lights if you are not in that room.
- Turn off or unplug any appliance you are not using. Computer monitors and TV's do use enough power to make a difference.
- In the heat of the day, pull your shades. In the summer this can make a difference in your bill.

- In the summer set your thermostat to 78 - winter to 68. Even 2 degrees can make a huge difference in your bill at the end of the month!
- Close off rooms and shut the vents to rooms you are not using.

Cheap and Easy Fixes

- Check all exterior doors and windows for weather stripping and caulking.

- Be sure to change filters regularly on A/C and heaters. Dirty filters restrict air flow and make the appliance work harder = more \$\$ on your bill!
- Use insulated curtains or drapes on windows that are particularly exposed to heat or cold.

- Use energy saving film on windows which are directly exposed to the summer sun.
- Try a programmable thermostat to save on heating and cooling when you are not home.

Long Term Savings

- If you need a new appliance, get an energy star rated item to save on your power bill. Check into government tax rebate programs for major appliances like heating and A/C.

- Consider the use of solar energy, if feasible. There are low-to-no cost programs for qualifying households.

- Replacing old single-pane windows with energy efficient windows can save 7-15% on power bills. Check into tax rebate programs for window replacements.
